

Hints for 1.2 Storm

- The same stormy mechanism is used across all grids, though with different regional scales.

- Australian cyclones use the AUS scale, Philippine typhoons use PAGASA, and Atlantic hurricanes use SSHW. You only need one letter from each storm.
- Index each storm by their category or signal number. Conveniently, you can find these on wikipedia pages on retired names. The 25 extracted letters should be laid straight into the grid and then read around.
