

Hints for 4.3 Disc

Whoa, what a big number. It ends with a one, but I wonder if it's prime?

If its not prime, then what?

In Melatos' office behind the terminal you find a very different kind of disc! It has a fine spiral that runs from the outer edge to the centre, becoming thinner and thinner, so that about 3/4rds of the way to the centre, you are unable to see it at all! Looking at a random spot on the outermost section, you see a "2" below a "c". At a spot closer in a "za" with "650". And bit closer to the center still, "cab" and "1353".
If its not prime, then what?

The terminal still seems to be busy, but looking closely at its output, you see
a name, "Karim Balabas". Strange.
